

FirstPROOF v3.1.5 Release Notes

The 3.1.5 release of FirstPROOF is a minor update containing a number of specific bug fixes and changes to resolve specific customer issues. It is not necessary to upgrade to this release unless you have encountered any of the issues mentioned below.

1. Changes and Fixes To FirstPROOF:

1. Added support for version 5 Harlequin PGBs (subject to the previous limitations of older versions of the Harlequin RIP when used with FirstPROOF); this now provides support back to version 3.x of the Harlequin RIP (so we now support version 3.x, 4.x, 5.x, 6.x and 7.x of the Harlequin RIP).

2. Changes and Fixes To FirstPROOF Std:

n/a

3. Changes and Fixes To FirstPROOF Pro:

1. The range of the Dot Gain control in the Dot Gain Manager has been increased from “0.5 to 1.0” to “0.5 to 1.5”. This more than doubles the amount of Dot Gain that can be dialed in (by 2¼ to be precise).
2. The Multi [Job] Selection Manager has been extended to allow the addition of multiple jobs in one go; use the shift and control/command key to select/deselect multiple jobs in the list (as one would in any list).
3. The memory management module, especially when printing could be too aggressive, especially when using a computer with lots of memory (for example 2Gb of RAM) and occasionally allocate too much memory. This could lead to subsequent attempts to allocate memory failing, resulting in ‘red areas’ when viewing or printing. This has been improved and additional memory recovery methods put in place too. You should not see ‘red’ anymore.

4. Mac Changes and Fixes:

n/a

5. PC Changes and Fixes:

n/a

6. Other Changes and Fixes:

n/a
